Most Basement Waterproofing Systems rely on a sump pump as the final mechanism to get the water out of the basement. The sump pump is the HEART of the system. If the heart stops for any reason, your basement gets flooded despite all the money you paid to dry it up.

If you are going to rely on a sump pump, you should make it a high-quality SuperSump®.

The SuperSump® is the finest sump system on the market* and includes the most reliable pump available, a WaterWatch® Alarm System, and the patented SuperLiner® with Airtight Lid!

*with the exception of our “TripleSafe” pump system

The state-of-the-art SuperSump® is the best on the market!

1. The Pump
The SuperSump® includes the finest pump available—a high-end, 1/3 hp Zoeller cast iron pump with a mechanical float switch. This pump was chosen as the best from among nearly 50 models. It pumps 2650 gallons per hour smoothly and quietly. It resists clogging and can pump up to 1/2" solids. It will perform reliably for many years. (Larger pumps are available for various applications.)

Although the pump is very quiet, the discharge line is equipped with 2 rubber fittings for additional sound and vibration reduction. Even higher volume pumps are optional.

The SuperSump® is equipped with an airtight floor drain. A floating ball in the drain creates a seal.

This unique feature will drain any water from your basement floor coming from unplanned leakage, such as a broken pipe, etc.

The CleanPump® Stand is designed to fit in the bottom of the SuperSump® ensuring that silt and sediment washing in doesn’t block the flow to the water inlet on the bottom of the pump.

2. The WaterWatch® Alarm System
Relying on a sump pump without an alarm makes no sense. If the circuit breaker trips, the pump cord is unplugged or the pump fails for any other reason, you experience costly flood damage without warning. The patented WaterWatch® sounds off (like a smoke detector) if the water rises above the point where the pump should turn on. This gives you warning to address the problem before any damage occurs. UltraSump® battery backup pumps are available to pump in a power outage. (see back cover).

3. The SuperLiner™
The patented 18" x 24" smooth wall polyethylene liner is rugged, heavy-duty, and has holes to allow water to flow in directly from below the floor. It features an exclusive “pump ring” on the floor of the liner which prevents the switch from hanging up on the sidewalls by keeping the pumps in the center.

SuperSump® and WaterGuard® have been awarded multiple patents in the USA, Canada and the United Kingdom.

A SuperSump® installation is a vast improvement. SuperSumps® look clean and neat and work better. Nothing can fall into the sump hole, and small children are kept out.

Without using a SuperSump®, this is what you may get. Open sump holes let in moisture, odours, bugs and radon gas.

The SuperSump® is a great improvement even in this older, "rough" looking basement.

No storage space is lost with a SuperSump® as items can be stacked on top. Add a DryTrak® or WaterGuard® system for a complete basement water control system. Ask your dealer for details.

SuperSumps® can be equipped with optional UltraSump® battery back-up pump systems like this one. There is a second pump in the SuperSump® which runs off battery power to protect you in a power failure. Ask your dealer for details.

UltraSump®
Battery Backup System

Sump Pump Backup Protection, 24 Hours a Day,
Whether You’re Home or Away!

As an addition to your SuperSump®, we recommend a back-up pumping system. The UltraSump® represents the state-of-the-art in battery backup pumping systems. When added as an option to our SuperSump®, the UltraSump® will turn on automatically if the primary pump fails to operate. The UltraSump® includes a second DC operated pump, a second automatic switching system, a ‘smart’ charging system, and a high-quality 120 amp battery.

The reliable UltraSump® backup pump is designed and manufactured by Wise Basement Systems specifically for our applications. When your primary pump fails because of a power outage or any other reason, the water rises and automatically turns on your UltraSump® backup system, which is powered by a battery specifically designed for long term standby use. When power is restored the battery is automatically recharged for the next emergency. The high-tech charging system was engineered for this purpose. The UltraSump® will pump out over 11,000 gallons on a new, fully-charged battery, giving you time to restore the primary pump before a flood occurs. The optional UltraSump® battery switcher (nominally not included) allows two batteries to be hooked up to the UltraSump® to double its pumping capacity.

You can rest easy 24 hours a day knowing the UltraSump® is on the job; especially when you are away from home. Its outstanding 2000 gallon per hour output, automatic electronic ‘smart’ charger, heavy duty motor and reliable switch, are a winning combination. For the newest, state-of-the-art protection, ask about TripleSafe® Sump System.
